

Salesforce Interview Readiness Bootcamp

– Day 4

Lightning Web Components (LWC)

Task 1 – Think Before Coding

1. **Why do users need a graphical interface?**
Users need a graphical interface to use the application easily without writing code.
2. **Why can't users directly execute SOQL queries?**
Users cannot execute SOQL directly because it is meant for developers and database access.
3. **Why is JavaScript required in LWC?**
JavaScript is used to add logic and make the component interactive.
4. **What responsibilities belong to the UI?**
The UI is responsible for displaying data and taking user input.
5. **Which responsibilities should remain in Apex?**
Apex handles database operations and business logic

Task 2 – Understanding LWC

HTML (placementHome.html)

Responsibilities

- Page Layout
- Text
- Buttons
- Images

JavaScript (placementHome.js)

Responsibilities

- Variables

- Logic
- Events
- Communication

Meta XML (placementHome.js-meta.xml)

Responsibilities

- Makes the component available in Lightning App Builder.
 - Specifies where the component can be used.
-

Task 3 – Hands-on Activity 1

Component Name

`placementHome`

Display Message

Welcome to Vishnu Placement Portal

Work Done

- Created the Lightning Web Component.
- Deployed it to a Lightning App Page.

- Verified the output successfully.

Task 4 – Hands-on Activity 2

Variables Created

Student Name : **Bhanu**

Roll Number : **23PA1A0579**

Department : **Computer Science and Engineering (CSE)**

Updated Values

Student Name : **Bhanu**

Roll Number : **23PA1A0579**

Department : **CSE**

Task 5 – Hands-on Activity 3

Button Label

Show Welcome Message

Output After Clicking

Welcome to Salesforce Development

Learning

Implemented button click events using JavaScript in Lightning Web Components.

Task 6 – Hands-on Activity 4

Initial Status

Status : **Not Applied**

After Button Click

Status : **Applied**

Learning

Used JavaScript to dynamically update the UI without using Apex or Database.

Task 7 – Mini Project Enhancement

Placement Portal

Today's Date: 03 August 2026

Welcome Student

Number of Companies: 25

Number of Jobs: 63

Applications Submitted: 5

Learning

Designed a simple Placement Management System home page using only Lightning Web Components.

Task 8 – Understanding Data Binding

Display

Hello **Bhanu**

(using `{studentName}`)

Observation

When the value of **studentName** in JavaScript was changed, the displayed text on the webpage automatically updated without modifying the HTML.

Explanation

This happens because Lightning Web Components use **one-way reactive data binding**, where the HTML automatically reflects changes made to JavaScript properties.

Task 9 – Interview Questions

1.What is LWC?

A. LWC is Salesforce's modern framework for building user interfaces.

2.Why did Salesforce introduce LWC?

A. Salesforce introduced LWC to build faster and more efficient applications.

3.Difference between LWC and Aura?

A. LWC is faster and simpler than Aura Components.

4.What are the three files inside an LWC?

A. HTML, JavaScript, and Meta XML.

5.Why is JavaScript required?

A. JavaScript adds logic and handles user interactions.

6.What is data binding?

A. Data binding automatically updates the UI when data changes.

7.Can LWC directly execute SOQL?

A. No, LWC uses Apex to execute SOQL.

8.Why does LWC need Apex?

A. LWC needs Apex to access and modify Salesforce data.

9.Where is the component deployed?

A. It is deployed using Lightning App Builder.

10.Explain the component you built today.

A. I built a Placement Portal component with student details, buttons, and a welcome message.
